

ED & C / Electrodesiccation and Curettage

Aftercare of your ED &C site: Leave the bandage in place that the nurse applied until the following day. Starting the day after the procedure, clean the area daily with soap and water or hydrogen peroxide. Apply petrolatum (Vaseline) or antibiotic ointment (eg. Polysporin) and a new band-aid. Do this daily until the area is healed over. The area may appear a little red and be a little soupy in the beginning. This is normal. Presence of pus or a lot of redness or tenderness is not. Please call our office if you have excessive redness, tenderness, pus or bleeding.
